

console

is much

more than

.log()

NamasteDev.com

console.log()

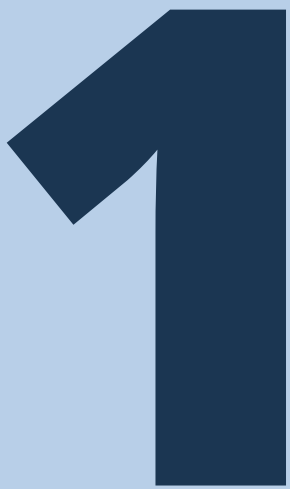

>> outputs a message to the console

console.count()

>> logs the number of times that this particular call to count() has been called

console.error()

>> outputs an error message to the console

console.clear()

>> clear the console

console.warn()

>> output warning message to console

console.trace()

>> output a stack trace to the console

console.time()

>> starts a timer (can track how long an operation takes)

console.timeEnd()

>> stops a timer that was previously started by console.time()

console.groupEnd()

>> exits the current inline group in the console

console.info()

>> outputs an informational message to the console

console.log()

>> outputs a message to the console

console.table()

>> displays tabular data as a table

console.assert()

>> writes an error message to the console if the assertion is false

console.groupCollapsed()

>> creates new inline group in the console. However, the new group is created collapsed. The user will need to use the disclosure button to expand it

console.group()

>> creates a new inline group in the console. This indents following console message by an additional level, until console.groupEnd() is called
